TITLE: The Application of Hydro-Mechanization in Strip Mining of Coal Deposits (Primeneniye gidromekhanizatsii pri otkrytykh razrabotkakh ugol'nykh mestorozhdeniy)

PERIODICAL: Mekhanizatsiya trudoyen'kikh i tyazhelykh rabot, 1958, N^o 7.
pp 20-22 (USSR)

ABSTRACT: For the first time, hydraulic mechanization was applied at strip mining operations at the Bogoslovskiy coal mines in 1930. Since that time, many big hydro-mechanical open pit coal miners have been constructed (the Baydakovskiy (1940-1949), the Rasturinskij (1943), the Krasnozel'skiy (1949-1951), the Bogoslovskiy Nr 1 (1943-1945), the Yermolayevskiy (1951-1955), the Nazarovskiy (1949) and other open pit coal mines). Hydro-mechanization of coal mines is more widely applied in the Soviet-Union than in the USA and Germany. Continuously improving the quality of hydromonitors, Soviet industry is now constructing the GWN hydromonitor, which possesses good hydraulic properties and is easy to operate; the GWN has a diameter of 300 mm with nozzles from 90 to 140 mm in diameter and a pressure head of 15 atm. At present, the Zavod ugol'nogo mashinostroyeniya im. Karla Marksa Irkutskogo sovnarkhoza (Coal Mining Machine Building

NAME: Nozzle pump for an internal combustion engine. Class 46, No. 169944

PLACE: Myulleten' izobratelyi i tekhnicheskikh zhurnalov, no. 7, 1965, 152

TOPIC PAGE: pump, internal combustion engine, injection nozzle

ABSTRACT: This Author Certificate presents a nozzle-pump for an internal combustion engine (see Fig. 1 on the Enclosure). The pump contains a casing with a rotary plunger of a valved type, a pressure valve, and a hydraulically operated atomized needle, a cam with a return spring for imparting axial motion to the plunger, and a rack-and-gear mechanism for turning the plunger. To simplify the construction and to increase the efficiency, the plunger is connected by a dog and a toothing to the turning mechanism mounted in a formed lid of the casing, which supports the cam. TITLE: Automatic 3-Phase Bath Welding at Kuybyshevgidrostroy
(Avtomaticheskaya trekhfaznaya vannaya svarka na Kuybyshevgidrostroye)

PERIODICAL: Sb. statey. Ural'skiy politekhn. in-t (Collection of Articles, the
Ural Polytechnic Institute), 1956, Nr 62, pp 43-50

ABSTRACT: At the present time, resistance butt welding is the fundamental welding method for end-to-end joining of heavy reinforcement rods used in hydro-engineering projects. Despite its high productivity, the method does not satisfy today's requirements because of the high cost and short life of welding equipment, complicated equipment operation, and a high electric-energy consumption. As a substitute, a 3-phase bath welding, developed and tested by the Chair of Welding, the Ural Polytechnic Institute, in cooperation with Kuybyshevgidrostroy, is worth attention. As distinguished from an early welding method using an expensive and short-lived detachable copper mold, the new method permits welding under flux in a welded-on steel clamp by means of an auto-

AUTHOR: Dorofeyev, A. N.; Nikonov, I. P.; Malyanov, V. D.

TITLE: Vibration strength of electroriveted joints as a function of the number of electrorivets in a longitudinal row

PERIODICAL: Referativnyy zhurnal, Mekhanika, no. 4, 1962, 57, abstract 4V482
(Sb. nauchn. tr. Ural'skiy politekhn. in-t, vyp. 122, 1961, 254-267)

TEXT: The authors adduce data on the distribution of forces in joints consisting of arc spot weldings or points disposed in a single line. They reach a conclusion with use of equations in finite differences. The conclusion is to the effect that an increase in the number of points in a longitudinal row above 5 or 6 does not load the extreme points, and that therefore increasing this number is useless if intended to increase the strength of the joints. They present data from an experimental study of samples; these show that with repeated loadings at cycle r equals 0.4 with number of points greater than seven, the bearing capacity of the joint is lowered in comparison with the optimal number of points (about 5). With a small number of points, the bearing capacity of a joint is increased linearly as they increase; but with n greater than 4, this increase drops off sharply, being followed by an actual decrease. G. A. Nikolayev.

TITLE: Consumable-electrode three-phase arc welding of AMts aluminum alloy plate

SOURCE: Svarochnoye proizvodstvo, no. 1, 1966, 18-19

TOPIC TAGS: arc welding, aluminum alloy, welding electrode, power welding equipment,
fabricated structural metal/ AMts aluminum alloy

ABSTRACT: The results of an investigation of this method of welding 25-30 mm thick plate of AMts aluminum alloy at the Ural Polytechnic Institute are presented. A modernized WPI-UZTM-3 three-phase arc welding installation was used for the experiments; it was fitted with a special electrode holder including a clamp for keeping the electrode in a properly centered position (Fig. 1), and a low-voltage three-phase transformer as the power source. Specifications: electrode diameter 2 mm; welding current 350-500 a; arc voltage 30-37 v, electrode feed rate 380-440 m/hr; welding rate 8-12 m/hr; flux thickness 13-14 mm. The electrode was also made of AMts aluminum alloy (1.3% Mn, 0.37% Fe, 0.23% Si). Mechanical tests showed that the stress-rupture

strength of the weld metal in the direction perpendicular to the weld axis is greater than the strength of the metal of the near-weld zone. Compared with single-phase submerged arc welding and nonconsumable-electrode three-phase arc welding, this new method of aluminum welding displays the following advantages: a) the use of AC makes it possible to markedly increase the efficiency of the welding installation (to 0.9 compared with an efficiency of 0.1-0.6 for DC); b) the welding of plate 25 mm thick and thicker is accomplished in a single operation, thus greatly accelerating the welding rate; c) the use of an automatic current regulator makes it possible to rapidly adjust the welding head to the specified current regime without altering the current in the electrodes; d) special operations to pickle the base metal and electrode are not required. TITLE: Certain indicators of the three-phase consumable-electrode arc welding of aluminum and its alloys

SOURCE: Automaticeskaya svarka no. 8, 1965, 51-53

TOPIC CODES: consumable electrode arc welding, three-phase arc welding, arc welding, single phase arc welding, fusion welding, build-up factor, aluminum alloy, power requirements

ABSTRACT: In three-phase arc welding, welding productivity is characterized by the amount of metal welded per time unit. The three-phase arc welding of aluminum and its alloys by means of a consumable electrode is characterized by the following technical and economic indicators: the build-up factor K_b , the fusion depth factor K_f , the overall productivity of the build-up and fusion processes P_{ov} , the percentage of loss and spatter, the unit power consumption per kg of built-up metal K_a , per kg of weld $K_{w,w}$, and parameter of weld $K_{e,w}$. In three-phase welding with elec-

trode wire of 2-3 mm diameter $K_3 = 10.65 \cdot 12.0$ g/a-hr compared with $K_1 = 8-9.4$ g/a-hr for single-phase welding with electrodes of the same diameter. Thus, in three-phase welding K_3 is generally 30% higher than in single-phase welding. The power requirement of three-phase welding is much smaller than that of single-phase welding, owing to the use of alternating three-phase current instead of direct current. Similarly, in three-phase welding of 25 mm thick sheets the welding rate is 24 kg/hr against 18 kg/hr for single-phase welding, and the build-up factor in three-phase welding is 8 g/a-hr against 6 g/a-hr for single-phase welding. In short, this comparison of two methods of consumable-electrode arc welding confirms the technical and economic advantages of three-phase welding over single-phase welding. Orig. art. has: 4 figures, 1 table, 4 formulas.

PERIODICAL: Sb. rats. predlozh. M-vo elektrotekhn. prom-sti SSSR, 1955,
Nr 54, pp 13-14

ABSTRACT: A brake magnet with a magnetic starter and two special-design emergency switches, one on each machine frame, have been installed for mechanical disconnection of the rolls from the drive. Each switch is attached to the frame by uprights and consists of a spring lever, a detent connected to a rope, and a two-pair-contact pushbutton. The rope can lift the detent causing the shutdown; the released lever presses against the pushbutton opening its upper contacts and closing its lower contacts. Opening the upper contacts cuts power to the motor starter and stops the motor. Closing the lower contacts

TITLE: Measuring the absorption of ultrasound in a liquid by the flow method

3/1

TYPE SOURCE: Sb. Primenenye ultrazvukov v issled. veshchestva Vysh. M.,
1962, 183-190

TOPIC TAGS: hydromechanics; ultrasonic radiation; ultrasound absorption; liquid flow

TRANSLATION: A simplified method is described for measuring the absorption of ultrasound. Theoretical investigations lead to a formula for the absorption factor

where η is the viscosity of the liquid under consideration, v is the flow velocity, ρ_c is the electrical resistance of the medium into which the sound is radiated, U is the voltage on the radiating element; k is a constant for which a computation formula is given; and r_1 , r_2 are the distances to the radiating element in the tube. The measurements were carried out at frequencies of 1, 2, 3, 4, 5 and 6 Megacycles/sec. The diameter of the tube was 28.31 mm. and that of the crystal was 35 mm. The results of the measurement of the

...-9-1-65

ACCESSION NR: AR40/7562

absorption factor in toluene and ethyl alcohol are presented in two tables. The measuring chamber was placed in a thermostat in order to eliminate any external influences. A certain study was made of the liquid flow in a discharge pipe (with the flow caused by the heat effect), at various positions of the pipe. On the basis of the results of these measurements, a graph is constructed illustrating the dependence of the flow velocity on the square of the voltage on the radiating element. The tests in ethyl alcohol were conducted at a frequency of 150 kilocycles/sec. in a tube with a diameter of 58 mm. It was noted that a heat flow was observed within 3-4 minutes and reached a steady-state condition within 10-15 minutes. For the sake of increased accuracy, the velocity was tested at each frequency with 4-5 different radiator voltages. Tuning of the radiating element to maximum radiation was found to have a definite effect on flow velocity. The results of the experiments led the authors to the following general conclusions: 1. when measuring the absorption of sound in a liquid by the flow method, it is possible to avoid making a determination of the intensity of the sound without lowering the accuracy of the test method; 2. it is essential to take into consideration the sound absorption heat effect which does have an effect on the flow caused by the sound. The results of these measurements are in full agreement with the findings of other workers. I. Nikolayeva.

TITLE: Resonance absorption of ultrasonics in acetic anhydride-ethanol mixture

SOURCE: Zhurnal fiz. khimii, v. 37, no. 8, 1963, 1887-1891.

TOPIC TAGS: coefficient of sound absorption, relaxation theory, ultrasonic absorption

ABSTRACT: It was established that the coefficient of sound absorption in an equimolar acetic anhydride-ethanol system at 20°C does not agree with the relaxation theory. The experimentally-observed much sharper drop in frequency dependence is nicely explained by resonance absorption of sound. The ultrasonic absorption in the 0.5-5 megacycle/sec. range was measured by the flux method of D. Hall and J. Lamb (Proc. Phys. Soc. 75, 1959, 354), and measured optically in the 5-20 megacycle/sec. range. Active complexes in the reaction mixture cause additional absorption of sound. In acetic anhydride, the anomalous absorption of sound is explained by the relaxation phenomena, caused by disturbance of the equilibrium between the rotatory isomers. Orig. art. has 5 figures, 5 equations.
